Tough job?

Get a tough bearing.

New upgraded SKF Explorer self-aligning roller bearings can provide up to twice the service life as the original under tough operating conditions

Combining clean and homogenous high-quality steel with an improved heat treatment, new upgraded SKF Explorer bearings have a superior balance between hardness and toughness. This advancement gives upgraded SKF Explorer self-aligning roller bearings a higher degree of wear resistance, enabling as much as twice the service life as the original, in applications where there are high levels of contamination or poor lubrication conditions.

All standard SKF spherical roller bearings, CARB toroidal bearings and most spherical roller thrust bearings have now been upgraded to the SKF Explorer performance class.

For more information on the product and actual test results, download the brochure from www.skf.com/upgrade.

Y– bearings and Y-bearing units

Except for the cage and seals, SKF Y-bearings (ball bearings) for high temperatures correspond in design to standard Y-bearings with grub screws in the YAR 2-2F series. The bearings have a shield and a flinger on both sides to prevent the ingress of solid contaminants into the bearing. The radial internal clearance is a multiple of C5 to prevent the bearings from seizing, even when they cool rapidly.

The entire surface of the bearing and the shields and flingers are manganese phosphated to enhance adhesion of the lubricant to the metal, thus improving the running-in properties of the bearing.

V-ring seals

Large diameter seals

Sealing solutions

Machined seals

SKF is the global market and technology leader in high quality custom engineered sealing solutions offering a comprehensive range of machined seals for many industries.

The innovative production system - SKF SEALJET - reduces manufacturing and dispatch time to a minimum. Virtually any kind of seal for any conceivable application, in any dimension and design, can be produced.

SKF offers machined sealing solutions for fluid power, fluid handling and power transmission applications including special large diameter seals with a virtually unlimited diameter range.

Oil seals

The demand for increased speeds, higher operating temperatures and synthetic lubricants with aggressive additives increase the stress on oil and grease seals. SKF seals deliver unparalleled performance over a wide range of operating conditions for most demanding applications.

Speedi-Sleeve

Over time, contaminants and conditions can cause particles to become trapped inside a lip seal. Particles then form wear grooves on the shaft, eventually leading to seal failure and severe shaft damage. Repairs are expensive, time-consuming and too often, ineffective. With an SKF Speedi-Sleeve, they are unnecessary.

Supplementary designations

N	Snap ring groove in outside cylindrical surface of the outer ring.
NR	As N , but with snap ring.
RS1	Contact type rubber seal with sheet steel reinforcement , at one side of the bearing.
2RS1	RS1 seals at both sides of the bearing.
RZ	Low friction seal of synthetic rubber with sheet steel reinforcement at on side of the bearing.
2RZ	RZ seals at both sides of the bearing.
Z	Shield (non-contact type) at one side of the bearing.
2Z	Z shields at both sides of the bearing.
ZN	Z shield at one side of the bearing and snap ring groove in outer ring.
ZNR	As ZN , but with snap ring.
2ZNR	As 2ZN , but with snap ring.
TN9	Glass fibre reinforced polyamide 6 , 6 window-type cage.
HN3	Stands for carbonitrided bearing. Performance of standard through hardened bearings can be drastically improved by the use of a surface heat treatment called carbonitriding. Carbonitriding is a high temperature heat treatment , which involves the diffusion of carbon and nitrogen into the surface of the steel. Deep Groove Ball Bearings (DGBB) with carbonitrided inner rings have been found to be twice as resistant compared to regular hardened DGBBs.
H	Stands for radial clearance in the upper half of the same clearance bracket e.g. 6002/C3H , here clearance for C3 is between 8 to 23 micron but for C3H clearance is between 15 to 23 micron. CNL Stands for radial clearance in the lower half of the same clearance bracket e.g. 6304/CNL , here clearance for normal bearing is between 5 to 20 micron but for CNL clearance is between 5 to 14 micron.
CNP	Stands for radial clearance which is a combination of the upper half of normal (CN) and the lower half of C3 range e.g. 6305/CNP , here the clearance for normal bearing is between 5 to 20 micron and 13 to 28 micron for C3. Hence , CNP clearance will be 13 to 21 micron.
VB133	Chamfer in bore deviating from basic bearing.
VQ091	Close bore diameter tolerance.
VB524	Chamfer in bore and outer diameter deviating from basic bearing.
VQ213	Special tolerance for bearing vibration & peaks.
MTF7&9	Here MT stands for medium temperature grease and F7 & F9 gives the quantities of grease.
GJN7	Here GJN stands for high temperature grease and 7 for grease quantity.
J	Pressed steel cage.
Q	SKF TQ Line bearings come with a logarithmic contact profile that provides for optimum stress distribution over roller/raceway contacts. Special design of sliding surfaces of guide flange and large roller ends considerably promotes lubricant film formation at roller end/flange contacts. Resulting benefits include increased operational reliability and reduced sensitivity to misalignment.

Internal clearance

The bearing internal clearance is defined as the total distance through which one bearing ring can be moved relative to the other under zero measuring load. Movement in the radial direction is called radial internal clearance; axial movement , axial internal clearance. The internal clearance is standardized.

Rolling bearings are delivered with different internal clearance. The internal clearance will vary from bearing type to bearing type. The most common clearance is NORMAL (with no suffix).

C1 = Bearing internal clearance smaller than C2
 C2 = Bearing internal clearance smaller than normal
 C3 = Bearing internal clearance greater than normal
 C4 = Bearing internal clearance greater than C3
 C5 = Bearing internal clearance greater than C4

Why internal clearance?

1. In order to fit a bearing tightly on a shaft it is necessary that the shaft is slightly larger than the bore of the inner ring. When the bearing is mounted , the inner ring will be expanded and consequently the space available for the rolling elements will be reduced. The reduction in space available for rolling elements when the bearing is mounted is accommodated by internal clearance
2. Steel will expand with increased temperature. In operation the temperature of the various parts of a bearing will not remain uniform and resulting in varying degrees of expansion , which is compensated by the internal clearance. The internal clearance required is dependent upon the mounting fit and the operating conditions. In case of doubt a bearing with greater clearance shall always be selected.

A large white semi-truck is driving on a two-lane road towards the viewer. The sun is low on the horizon to the left, creating a strong golden glow and long shadows. The sky is filled with dramatic, dark clouds. The truck is a modern model with a large grille and multiple headlights. The road has a white dashed line on the left and a solid line on the right.
